Data description:

symbol (text) – NSE stock symbol for stock
stock (text) – Name of the stock
ticker (text)- NSE identifier of the stock
price_date (date): The specific trading day or timestamp for the record.
open (numeric): The price of the asset when the market opened.
high (numeric): The highest price reached during that trading session.
low (numeric): The lowest price reached during that trading session.
close (numeric): The final trading price when the market closed for the day.
volume (integer) : Total number of shares available for trading
dividends (numeric) – Dividend paid by the company

Data Size: *Contains 20 years of historical returns of stocks*

	stock text	count bigint
1	State Bank of India	4932
2	Bharat Electronics Limited	4932
3	Oil & Natural Gas Corporation Limi...	4932
4	ICICI Bank Limited	4932
5	Bharti Airtel Limited	4932
6	HDFC Bank Limited	4932
7	Infosys Limited	4932
8	Tata Consultancy Services Limited	4932
9	Larsen & Toubro Limited	4932
10	Reliance Industries Limited	4932

Feature Engineering Tasks:

Calculate following derived fields:

day, month, year, is_quarter_end, open-close, low-high, target

Sample code for calculation of derived fields:

```
splitted = df['price date'].str.split('/', expand=True)
df['day'] = splitted[1].astype('int')
df['month'] = splitted[0].astype('int')
df['year'] = splitted[2].astype('int')
df['is_quarter_end'] = np.where(df['month']%3==0,1,0)
df['open-close']  = df['open'] - df['close']
df['low-high']  = df['low'] - df['high']
df['target'] = np.where(df['close'].shift(-1) > df['close'], 1, 0)
```

Prediction data: Perform the prediction on the following data set:

Data Location:

Sample Output (Target =1 : Buy, Target = 0: Sell):

State Bank of India	**Buy**
Bharat Electronics Limited	**Sell**
Oil & Natural Gas Corporation Limited	**Sell**
ICICI Bank Limited	**Buy**
Bharti Airtel Limited	**Buy**
HDFC Bank Limited	**Sell**
Infosys Limited	**Buy**
Tata Consultancy Services Limited	**Sell**
Larsen & Toubro Limited	**Buy**
Reliance Industries Limited	**Sell**

Problem Statement:

- Load the stock data
- Perform feature engineering (as mentioned above)
- Perform EDA
- Train the model – Pytorch with fastai
    - Train the model for **all the 10 stocks** with following features:
    - Prediction variables – ***Stock, open-close, low_high, is_quarter_end***
    - Predicted variable - ***target***
- Predict the result (for data provided for prediction)
- Output the result in format specified

Submission:

1) Code
2) Analysis and Results (PDF file)
    - Snapshots of EDA
    - Result/Output
